## FSUIPC4 Status of IPC Offsets for FSX

## Applicable to FSUIPC4 version 4.924

## Key for status indications:

Items in blue are new to FSX

Ok-SimC works okay using SimVars

Ok-SimC\* more or less works using SimVars, but there are difficulties (explained in Notes)

Ok-SimE for write only, works okay, but resorting to Sim Events via SimC, not SimVar

reads or writes

Ok-Lvar Okay using gauge local variables ("L:variables").
Ok-Intl works okay, is internal to FSUIPC in any case

Ok-Intl\* more or less works using internal derivation, but there are difficulties (explained

in Notes)

Ok-Hack works by hooks or patches or other devilish means

7-Intl May work, untested, but FSUIPC internal in any case

?-SimC Mapped to SimConnect variables, but validity unknown. Needs checking and

feedback please

?-SimE Mostly for write only, mapped to Sim Event, but operation unknown. Needs

checking and feedback please

?? situation unknown – try it or wait for next issue

No-SimC Not working, awaiting fix in SimConnect

No-SimE Not working, Sim Event seems broken, needs fix in FSX?

No-SimC+ Not working, hoping for additions to SimConnect

No Not supported. (Appeals to Pete Dowson, with reasons, please)

Not yet Maybe can do okay, but not yet got around to it!

No info Data unknown, not listed for SimConnect. Not yet followed through

Not tested Maybe already okay, not tested yet

Maybe Question mark, see italic text in "use" section

Problem See italic text in "use" section

N/A Not applicable

Offset	Size	Use	FSX Read	FSX Write
0000	32	Reserved for diagnostics		
0020	4	Ground altitude in Metres x 256. (see also offset 0B4C)	Ok-SimC	No
0024	256	READ: Zero terminated string giving the Start-Up situation or	Ok-Intl	No
		flight name, including the path (complete, or from the FS folder)	No	Ok-Intl
		WRITE: Operates a facility to "spoof" Flight Sim read-out values as supplied to all FSUIPC and WideFS client	NO	OK-IIIII
		applications.		
		To use this, write the following to offset 0024, as one structure (i.e. one FSUIPC_Write call):		
		struct {		
		WORD offset; // base offset of data to be overridden WORD length; // length of data (max 252) BYTE[] data; // Up to 252 bytes of data		
		};		
		The override is established the first time you do this for a specific offset		
		+ length combination. Any overlapping setting replaces the previous		
		one, but re-writing the same one with different data is fast as it merely writes to the relevant offsets the FS data is already being diverted.		
		Cancel the overrides by writing the same with no data and a length of 0.		
		If you don't cancel, but don't update, the override will be cancelled after about 12 seconds (not counting Menu time). Avoid letting this happen, though always explicitly cancel when finishing.		
		Note that not all FSX values can be overridden in this way, and none of		
		the normal FSUIPC values can be permanently overridden. However,		
		this facility does provide direct access to ALL offsets, and you can		
		easily wreck things and ruin someone's day! Those which are normally write-protected are not so protected using this facility.		
		The "Liar.lua" plug-in supplied with the Lua additions demonstrates this		
		facility, and also shows the only way provided of reading the un-		
		spoofed values: a privilege afforded only to the Lua ipc.readStruct facility in the Lua program which actually applies the overrides too.		
012C	1	The name of the current Log book—not available in FSX	No	No
0130	256	The current flight Plan path & file name (in UNC format if	Ok-SimC	Ok-SimC
		WideFS is in use).		
0230	8	"Absolute Time", in seconds, double float. This is unchecked,	Ok-SimC	No
		but is said to be the time since 12 noon on January 1 <sup>st</sup> , Year 0000		
0238	1	(?). Hour of local time in FS (0–23)	Ok-simC	?-SimE
0238	1	Minute of local time in FS (0–25)	Ok-simC	?-SimE
023A	1	Second of time in FS (0–59)	Ok-simC	Ok-SimE
		For setting, FSX provides "KEY_CLOCK_SECONDS_ZERO"		but Only setting
		only. No way to directly set a number of seconds.		Only setting zero when
				close – see
023B	1	Hour of Zulu time in FS (also known at UTC or GMT)	Ok-simC	Notes Ok-simE
023B 023C	1	Minute of Zulu time in FS (also known at 0 1°C of GM1)	Ok-simC	Ok-simE
023D	1	Zulu day of month in FS (counting from 1)	Ok-simC	No
023E	2	Day number in year in FS (counting from 1)	Ok-simC	?-SimE
0240	2	Zulu year in FS	Ok-simC	?-SimE
0242	1	Zulu month of year in FS	Ok-simC	No
0243	1	Zulu day of week in FS	Ok-simC	No
0244	1 1	Local month of year in FS	Ok-simC Ok-simC	No No
0245 0246	2	Local day of month in FS  Local time offset from Zulu (minutes). +ve = behind Zulu, -ve =	Ok-simC Ok-simC	No
0270	2	ahead	2	
0248	2	Season: 0=Winter, 1=Spring, 2=Summer, 3=Fall	Ok-Intl	No

			(Hack)	
0258	4	Memory currently assigned to FSUIPC4 (including WideServer)	Ok-Intl	No
		See also offset 024C. This is in Bytes.	N1/A	01.0:
0262	2	Pause control (write 1 to pause, 0 to un-pause).	N/A	Ok-SimE
0264	2	Pause indicator (0=Not paused, 1=Paused)	Ok-simE	N/A
0274	2	Frame rate is given by 32768/this value	Ok-SimE	N/A
0278	2	Auto-co-ordination ("auto-rudder"), 1=on, 0=off	Ok-SimC	No
		Different to FS9 and before: this setting cannot be changed via		
		any of the usual controls, or the documented as "settable"		
0200		SimVar. It is broken, an FSX/ESP bug!	Ol- Intl	Ola Indi
0280	1	Lights: this operates the NAV, TAXI, PANEL and WING lights.	Ok-Intl (via 0D0C)	Ok-Intl (via 0D0C)
0201		For separate switches see offset 0D0C	Ok-Intl	Ok-Intl
0281	1	Beacon and Strobe lights. For separate switches see offset 0D0C	(via 0D0C)	(via 0D0C)
028C	1	Landing lights. (See also offset 0D0C).	Ok-Intl	Ok-Intl
			(via 0D0C)	(via 0D0C)
029B	1	Alternate static air source (0=off, 1=on)	Ok-SimC	Ok-SimE
029C	1	Pitot Heat switch (0=off, 1=on)	Ok-SimC	Ok-SimE
02A0	2	Magnetic variation (signed, -ve = West). For degrees	Ok-SimC	N/A
		*360/65536. Convert True headings to Magnetic by <i>subtracting</i>		
0202		this value, Magnetic headings to True by <i>adding</i> this value.	No-SimC+	Ok-SimE
02B2	2	Zoom factor: 64=x1, 128=x2 et cetera	Ok-SimC+	
02B4	4	GS: Ground Speed, as 65536*metres/sec. Not updated in Slew	OK-SIMC	No
0200	1	mode!	Ok-SimC	?-SimC
02B8 02BC	4	TAS: True Air Speed, as knots * 128 IAS: Indicated Air Speed, as knots * 128	Ok-SimC	?-SimC
02BC 02C4		Barber pole airspeed, as knots * 128	Ok-SimC	No
02C4 02C8	4	Vertical speed, signed, as 256 * metres/sec. For the more usual	Ok-SimC	?-SimC
0208	4	ft/min you need to apply the conversion *60*3.28084/256	OK OIIIIO	· Omio
02CC	8	Whiskey Compass, degrees in 'double' floating point format	Ok-SimC	?-SimC
0200	o	(FLOAT64)		
02D4	2	ADF2 Frequency: main 3 digits, in Binary Coded Decimal. See	Ok-SimC	Ok-SimE
0201	~	also offset 02D6. A frequency of 1234.5 will have 0x0234 here		
		and 0x0105 in offset 02D6.		
02D6	2	Extended ADF2 frequency. The high byte contains the 1000's	Ok-SimC	Ok-SimE
	_	digit and the low byte the fraction, so, for a frequency of 1234.5		
		this offset will contain 0x0105.		
02D8	2	ADF2: relative bearing to NDB ( *360/65536 for degrees, -ve	?-SimC	No
		left, +ve right)		
02DC	6	ADF2 IDENTITY (string supplied: 6 bytes including zero	Ok-SimC	No
		terminator)		
02E2	25	ADF2 name (string supplied: 25 bytes including zero terminator)	Ok-SimC	No
02FB	1	ADF2 morse ID sound $(1 = \text{on}, 0 = \text{off})$ , read for state, write to	?-SimC	?-SimE
		control		
0300	2	VOR1 DME distance, 16-bit integer, nm * 10	Ok-SimC	No
0302	2	VOR1 DME speed, 16-bit integer, kts * 10	Ok-SimC	No
		VOD1 DME time to station 10 bit interes 200 \$ 10	Ok-Intl	No
0304 0306	2 2	VOR1 DME time to station, 16-bit integer, secs * 10 VOR2 DME distance, 16-bit integer, nm * 10	Ok-SimC	No

0308	2	VOR2 DME speed, 16-bit integer, kts * 10	Ok-SimC	No
030A	2	VOR2 DME time to station, 16-bit integer, secs * 10	Ok-Intl	No
030C	4	Vertical speed, copy of offset 02C8 whilst airborne, not updated	Ok-Intl	N/A
		whilst the "on ground" flag (0366) is set. Can be used to check		
		hardness of touchdown (but watch out for bounces which may		
		change this).		
0310	8	Timer (double float, elapsed seconds including fractions,	Ok-Intl	No
		adjusted each 'tick' – i.e. $1/18^{th}$ sec). See also 0368		
0318	4	Pressurisation cabin altitude at present (feet, 32-bit integer)	?-SimC	No
031C	4	Pressurisation cabin altitude set goal (feet, 32-bit integer)	?-SimC	No
0320	4	Pressurisation cabin altitude set change rate (feet/sec, 32-bit	?-SimC	No
		floating point)		
0324	4	Pressurisation cabin pressure differential (lbs/sq.ft, 32-bit	?-SimC	No
		floating point): set – actual.		
0328	4	Pressurisation dump switch $(1 = open, 0 = closed)$	?-SimC	?-SimE
032C	2	"Plane is in fuel box" flag (same as Scenery BGL variable 0288)	No	No
032E	2	Reserved (used internally)	N/A	N/A
0330	2	Altimeter pressure setting ("Kollsman" window). As millibars	Ok-SimC	Ok-SimE
		(hectoPascals) * 16		
0332	2	Altimeter pressure secondary setting ("Kollsman" window). As	Ok-SimC	Ok-SimE
		millibars (hectoPascals) * 16. This is the one used in the G1000		
		gauge.		
0334	4	Pushback angle, radians, as a 32-bit Float.	Ok-SimC	No
0338	4	Pushback X contact, feet, as a 32-bit Float.	Ok-SimC	No
033C	4	Pushback Y contact, feet, as a 32-bit Float.	Ok-SimC	No
0340	4	Pushback Z contact, feet, as a 32-bit Float.	Ok-SimC	No
0344	2	Pushback wait flag, 16-bit integer (probably only 0 or 1)	Ok-SimC	No
0346	1	Surface condition: 0=normal, 1=wet, 2=icy, 3=snow	Ok-SimC	No
0347	1	Surface info valid flag. [not working ignore]	No	No
0348	2	Structural ice formation quantity, 0 - 16384	Ok-SimC	No
034A	2	Pitot ice formation quantity, 0 - 16384	Ok-SimC	No
034C	2	ADF1 Frequency: main 3 digits, in Binary Coded Decimal. See	Ok-SimC	Ok-SimE
		also offset 0356. A frequency of 1234.5 will have 0x0234 here		
		and the second of the second o		
		and 0x0105 in offset 0356.		
		and 0x0105 in offset 0356. (See also offset 0389)		
034E	2	and 0x0105 in offset 0356. (See also offset 0389)  COM1 frequency, 4 digits in BCD format. A frequency of	Ok-SimC	Ok-SimE
		and 0x0105 in offset 0356. (See also offset 0389)  COM1 frequency, 4 digits in BCD format. A frequency of 123.45 is represented by 0x2345. The leading 1 is assumed.		
034E 0350	2	and 0x0105 in offset 0356. (See also offset 0389)  COM1 frequency, 4 digits in BCD format. A frequency of 123.45 is represented by 0x2345. The leading 1 is assumed.  NAV1 frequency, 4 digits in BCD format. A frequency of	Ok-SimC	Ok-SimE Ok-SimE
0350	2	and 0x0105 in offset 0356. (See also offset 0389)  COM1 frequency, 4 digits in BCD format. A frequency of 123.45 is represented by 0x2345. The leading 1 is assumed.  NAV1 frequency, 4 digits in BCD format. A frequency of 113.45 is represented by 0x1345. The leading 1 is assumed.	Ok-SimC	Ok-SimE
		and 0x0105 in offset 0356. (See also offset 0389)  COM1 frequency, 4 digits in BCD format. A frequency of 123.45 is represented by 0x2345. The leading 1 is assumed.  NAV1 frequency, 4 digits in BCD format. A frequency of 113.45 is represented by 0x1345. The leading 1 is assumed.  NAV2 frequency, 4 digits in BCD format. A frequency of		
0350 0352	2	and 0x0105 in offset 0356. (See also offset 0389)  COM1 frequency, 4 digits in BCD format. A frequency of 123.45 is represented by 0x2345. The leading 1 is assumed.  NAV1 frequency, 4 digits in BCD format. A frequency of 113.45 is represented by 0x1345. The leading 1 is assumed.  NAV2 frequency, 4 digits in BCD format. A frequency of 113.45 is represented by 0x1345. The leading 1 is assumed.	Ok-SimC	Ok-SimE Ok-SimE
0350	2	and 0x0105 in offset 0356. (See also offset 0389)  COM1 frequency, 4 digits in BCD format. A frequency of 123.45 is represented by 0x2345. The leading 1 is assumed. 04CF	1	ADVENTURE WEATHER: This provides the CLOUD_HIGH_COVER 0–8	?-Intl	No
04D2	2	Precipitation control: write hi-byte=type 0–2, low byte=rate 0–5. Write 0xFFFF to release control back to FS.	N/A	?-Intl
04D4	2	Dew point control: degrees C * 256. Sets surface layer dewpoint only, FSUIPC does rest. Write 0x8000 to release control back to FS.	N/A	?-Intl
04D6	2	Set to 0xFADE if FSUIPC's weather interface has initialised.	Ok-Intl	No
04D8	2	Surface layer wind speed, in knots. This may be different to the current wind speed at the aircraft—see offset 0E90. This also provides WIND_SURF_VEL for Adventures.	?-intl	No
04DA	2	Surface layer wind direction, *360/65536 to get degrees MAGNETIC. This may be different to the current wind direction at the aircraft—see offset 0E92. This also provides WIND_SURF_DIR for Adventures.	?-Intl	No
04DE	2	Weather option control: not supported	No	No
04E0	88	Area reserved for Project Magenta	N/A	N/A
0538	8	Design speed VS0 (stall speed full flaps), ft/sec, as a double (64-bit floating point).	Ok-SimC	No
0540	8	Design speed VS1 (stall speed clean), ft/sec, as a double (64-bit floating point).	Ok-SimC	No
0548	8	Design speed VC (cruise speed), ft/sec, as a double (64-bit floating point).	Ok-SimC	No
0550	8	Minimum drag velocity, ft/sec, as a double (64-bit floating point).	Ok-SimC	No
0558	4	INITIAL POSITION: Airspeed setting.	N/A	Ok-SimC
		Write the desired airspeed here (in knots), along with, <i>in the same IPC write</i> , those of the following fields (on-ground, LLAPBH – Lat/Lon/Alt/Pitch/Bank/Hdg) which you need to set. FSUIPC4 will use the <i>INITIAL POSITION</i> facility in FSX to place your aircraft and set the speed.		
		To set the speed at the current position (but not on ground), just write this offset and FSUIPC4 will use the following values as they currently stand.		
055C	4	INITIAL POSITION: On-ground setting.  Write 0 for in-flight or 1 for on-ground here, along with, in the	N/A	Ok-SimC
		same IPC write, those of the following fields (LLAPBH – Lat/Lon/Alt/Pitch/Bank/Hdg) which you need to set. FSUIPC4 will use the INITIAL POSITION facility in FSX to place your aircraft. It will set the speed to 0 if the on-ground value is non-zero, but otherwise it will use the current airspeed from 02BC.		
0560	8	Latitude of aircraft in FS units.  (Read offset 6010 for easier conversion!)  To convert to Degrees:  If your compiler supports long long (64-bit) integers then use such a variable to simply copy this 64-bit value into a double	Ok-SimC	Ok-SimC

		floating point variable and multiply by 90.0/(10001750.0 *		
		65536.0 * 65536.0).  Otherwise you will have to handle the high 32-bits and the low 32-bits separately, combining them into one double floating point value (say dHi). To do, copy the high part (the 32-bit int at 0564) to one double and the low part (the 32-bit unsigned int at 0560) to another (say dLo). Remember that the low part is only		
		part of a bigger number, so doesn't have a sign of its own. Divide dLo by (65536.0 * 65536.0) to give it its proper magnitude compared to the high part, then either add it to or		
		subtract it from dHi according to whether dHi is positive or negative. This preserves the integrity of the original positive or negative number. Finally multiply the result by 90.0/10001750.0		
		to get degrees. Either way, a negative result is South, positive North.		
		[Can be written to move aircraft]		
0568	8	Longitude of aircraft in FS format.	Ok-SimC	Ok-SimC
		(Read offset 6018 for easier conversion!)		
		To convert to Degrees:		
		If your compiler supports long long (64-bit) integers then use		
		such a variable to simply copy this 64-bit value into a double floating point variable and multiply by 360.0/(65536.0 * 65536.0 * 65536.0).		
		Otherwise you will have to handle the high 32-bits and the low		
		32-bits separately, combining them into one double floating		
		point value (say dHi). To do, copy the high part (the 32-bit int at		
		056C) to one double and the low part (the 32-bit unsigned int at		
		0568) to another (say dLo). Remember that the low part is only		
		part of a bigger number, so doesn't have a sign of its own.		
		Divide dLo by (65536.0 * 65536.0) to give it its proper		
		magnitude compared to the high part, then either add it to or		
		subtract it from dHi according to whether dHi is positive or		
		negative. This preserves the integrity of the original positive or negative number. Finally multiply the result by 360.0/(65536.0 *		
		65536.0) to get degrees.		
		Either way, a negative result is West, positive East. If you did it		
		all unsigned then values over 180.0 represent West longitudes of		
		(360.0 – the value).		
		[Can be written to move aircraft]		
0570	8	Altitude, in metres and fractional metres. The units are in the	Ok-SimC	Ok-SimC
		high 32-bit integer (at 0574) and the fractional part is in the low		
		32-bit integer (at 0570). [Can be written to move aircraft]		
		(Read offset 6020 for easier conversion!)

		model helicopter only		
081F	1	Rotor Clutch Active $(0 = off, 1 = on)$ . Applicable to Robinson	Ok-SimC	No
0011	-	model helicopter only		
0820	1	Rotor Chip Detected $(0 = off, 1 = on)$ . Applicable to Robinson	Ok-SimC	No
		model helicopter only		
0821	1	Rotor Gov Active $(0 = off, 1 = on)$ . Applicable to Robinson	Ok-SimC	No
		model helicopter only		
0822	2	Rotor brake application (0 to 16384). Applicable to Robinson	Ok-SimC	Ok-SimE
		model helicopter only. Writing: there appears no way to set the		(but see notes)
		level of braking directly. The only way to influence it is to send		
		Rotor Brake controls. In an attempt to achieve the written value,		
		FSUIPC4 send Rotor Brake controls to FSX on every FS frame		
		whilst the read-out for the rotor braking value is less than that		
		last written to 0822. There is an exception—if the read-out remains zero for 4 such attempts, the written value is reset to		
		zero too. This is to infallibly cope with aircraft with no		
		implemented rotor brake, avoiding continuous useless control		
		applications		
		This was intended to achieve the result of a sustained brake		
		pressure oscillating close to the value being written, but		
		unfortunately the Rotor Brake control imposes immediate		
		maximum brake pressure but with a fast reduction. The result, therefore, is an oscillation between maximum and just under the		
		requested value.		
0824	2	Rotor lateral trim (0 to 16384). Applicable to Robinson model	?-SimC	?-SimE
		helicopter only		
0826	1	Rotor Gov switch $(0 = off, 1 = on)$ . Applicable to Robinson	Ok-SimC	Ok-SimE
		model helicopter only		
0828	8	Rotor transmission temperature (64-bit double float, in degrees	?-SimC	No
		Rankine). Possibly only applicable to Robinson model		
		helicopter, but no success in seeing this!		
0830	2	Action on crash (not working).	No	No
		For FS2004 and before this was a 4-byte value. Now the two		
0832	1	high bytes are used for flags as shown in the next two entries.  Crash detection: 1=Crash detection is on, 0 = off	?-SimC	No
0833	1 1	Crash detection: 1=Crash with other aircraft is on, 0 = off	?-SimC	No

		glideslope transmitter Longitude.		
0868	4	VOR2 Elevation in metres. If NAV2 is tuned to an ILS this gives	Ok-SimC	N/A
		the glideslope transmitter Elevation.		
086C	4	VOR1 Elevation in metres. If NAV1 is tuned to an ILS this gives	Ok-SimC	N/A
		the glideslope transmitter Elevation.		
0870	2	NAV1 ILS localiser inverse runway heading if VOR1 is ILS.	Ok-SimC	N/A
		Convert to degrees by *360/65536. This is 180 degrees different		
		to the direction of flight to follow the localiser.		
0872	2	NAV1 ILS glideslope inclination if VOR1 is ILS. Convert to	Ok-SimC	N/A
		degrees by *360/65536		
0874	4	VOR1 Latitude, as in 085C above, except when NAV1 is tuned	Ok-SimC	N/A
		to an ILS, in which case this gives the localiser Latitude.		
0878	4	VOR1 Longitude, as in 0864 above, except when NAV1 is tuned	Ok-SimC	N/A
00.0	•	to an ILS, in which case this gives the localiser Longitude.		
087C	4	VOR1 Elevation, as in 086C above, except when NAV1 is tuned	Ok-SimC	N/A
0070	7	to an ILS, in which case this gives the localiser Elevation.		
0880	4	DME1 Latitude when available separately. Same units as in	Ok-SimC	N/A
0000	7	085C above.	OR OMIC	1471
0884	4	DME1 Longitude when available separately. Same units as in	Ok-SimC	N/A
0004	4		OK-OIIIIO	IVA
0000	1	0864 above.	Ok-SimC	Ok-SimC
0888	1	Active engine (select) flags. Bit 0 = Engine 1 selected Bit 3 =	OK-SIIIIC	OK-SIIIC
0000	1	Engine 4 selected. See notes against offset 0892.	2 Cim C	2 Cim F
0889	1	Rotor clutch switch, when applicable. 1=On, 0=Off. Can be read	?-SimC	?-SimE
		and written.		
088A	2	DME1 Elevation in metres, when available separately.	Ok-SimC	N/A
088C	152	ENGINE 1 values, as detailed below		
088C	2	Engine 1 Throttle lever, –4096 to +16384	Ok-SimC	Ok-SimC
		[Programs controlling throttle directly from user inputs should		
		write to 089A instead if the input should be disconnectable via		
		offset 310A (e.g. for auto-throttle management)]		
088E	2	Engine 1 Prop lever, -4096 to +16384	Ok-SimC	Ok-SimC
0890	2	Engine 1 Mixture lever, 0 – 16384	Ok-SimC	Ok-SimC
0892	2	Engine 1 Starter switch position (Magnetos),	Ok-	Ok-SimE/Int
		Jet/turbojet: 0=Off, 1=Start, 2=Gen/Alt	SimC/Intl	
		Prop: 0=Off, 1=right, 2=Left, 3=Both, 4=Start		
		Don't forget to switch fuel on to start (mixture to max).		
0894	2	Engine 1 combustion flag (TRUE if engine firing)	Ok-SimC	?-SimC
0896	2	Engine 1 Jet N2 as 0 – 16384 (100%). This also appears to be the	Ok-SimC	?-SimC
		Turbine RPM % for proper helo models (and now also for the		
		FS2004 Robinson model and derivatives)		
0898	2	Engine 1 Jet N1 as 0 – 16384 (100%), or Prop RPM (derive	Ok-SimC	?-SimC
0070	2	RPM by multiplying this value by the RPM Scaler (see 08C8)		
		and dividing by 65536). Note that Prop RPM is signed and		
		negative for counter-rotating propellers.		
		In FS2004 this also now gives the Robinson model's RPM, when		
000 4	2	scaled by the RPM scaler.	N/A	Ok-Intl
089A	2	Engine 1 Throttle lever, –4096 to +16384, same as 088C above	IN/A	OK-IIIII
		except that values written here are treated like axis inputs and are		
		disconnectable via offset 310A, and have the last written value		
	_	obtainable from offset 3330		0.00
08A0	2	Engine 1 Fuel Flow PPH SSL (pounds per hour, standardised to	Ok-SimC	?-SimC
		sea level). Don't know units, but it seems to match some gauges		
08B2	2	if divided by 128. Not maintained in all cases.  Engine 1 Anti-Ice or Carb Heat switch (1=On)	Ok-SimC	Ok-SimE

08B8	2	Engine 1 Oil temperature, 16384 = 140 C.	Ok-SimC	?-SimC
08BA	2	Engine 1 Oil pressure, 16384 = 55 psi. Note that in some aircraft	Ok-SimC	?-SimC
OODA	2	(eg the B777) this can exceed the 16-bit capacity of this location.		
		FSUIPC limits it to fit, i.e.65535 = 220 psi		
08BC	2	Engine 1 Pressure Ratio (where calculated): 16384 = 1.60	?-SimC	?-SimC
08BE	2	Engine 1 FG55dF Radio (where edicadaed). 1656 F = 1.66  Engine 1 EGT, 16384 = 860 C. [Note that for Props this value is	Ok-SimC	?-SimC
OODL	-	not actually correct. You will get the correct value from 3B70.		
		The value here has been derived by FSUIPC to be compatible		
		with FS2004, FS2002 et cetera]		
08C0	2	Engine 1 Manifold Pressure: Inches Hg * 1024	Ok-SimC	?-SimC
08C8	2	Engine 1 RPM Scaler: For Props, use this to calculate RPM – see	Ok-Intl*	N/A
		offset 0898	(see note)	
		(On turboprops this will give the shaft RPM, since there is currently no		
		Gear Reduction Ratio available to fix values on such aircraft. I will fix this		
08D0	4	when I can) Engine 1 Oil Quantity: 16384 = 100%	Ok-SimC	?-SimC
08D4	4	Engine 1 Vibration: 16384 = 5.0. This is a relative measure of	Ok-SimC	No
00D4	7	amplitude from the sensors on the engine which when too high is		
		an indication of a problem. The value at which you should be		
		concerned varies according to aircraft and engine.		
08D8	4	Engine 1 Hydraulic pressure: appears to be 4*psi	Ok-SimC	No
08DC	4	Engine 1 Hydraulic quantity: 16384 = 100%	Ok-SimC	No
08E8	8	Engine 1 CHT, degrees F in double floating point (FLOAT64)	?-SimC	?-SimC
08F0	4	Engine 1 Turbine temperature: degree C *16384 (Helos?)	?-SimC	?-SimC
	•	(Turbine engine ITT)		
08F4	4	Engine 1 Torque % (16384 = 100%). This is correct for true	?-SimC	?-SimC
		Helo models like the Bell. Other prop-based models have this		
		computed by FSUIPC4 from the actual torque in 0920, assuming		
		a maximum of 600 ft-lbs.		
08F8	4	Engine 1 Fuel pressure, psf (i.e. psi*144): not all aircraft files	?-SimC	?-SimC
		provide this, valid for helo models?		
08FC	4	Engine 1 Electrical Load. (some sort of percentage as a	?-SimC	No
		proportion of 16k or 64k?). True helo models only I think.		
0900	4	Engine 1 Transmission oil pressure (psi * 16384): for true helos	?-SimC	No
0904	4	Engine 1 Transmission oil temperature (degrees C * 16384): for	?-SimC	No
		true helos		
0908	4	Engine 1 Rotor RPM % (16384=100%): for true helos	?-SimC	No
090C	4	Engine 1 fuel used since start (in pounds, 32-bit float)	Ok-SimC	No
0910	4	Engine 1 fuel elapsed time (in hours, 32-bit float)	Ok-SimC	No

		This was previously the Path and Filename reading facility, as		
		follows, for reading into offset 1000 one of::		
		1. The default Flight path		
		2. The AI traffic pathname for a specified AI aircraft (see		
		parameter) [FS2004 only]		
		3. The filename (no path) of the last saved Flight (FLT) file.		
		However, since version 3.47 of FSUIPC, the filename of the last saved flight has been readable directly at offset 0400. So it really isn't needed here with a complex protocol, and at present there are no plans to support the AI traffic pathname option in FSX or beyond (though if it requested I would look at placing it elsewhere).  So, there's only one use for the area at 1000 now and that is as		
		shown below. Consequently, for compatibility, FSUIPC will now always set 0FF0 to zero and continually change the timestamp at 0FFC

11B6 11B8 11BA 11BE 11BE	1 2 2 2 2 2 2 1	Aircraft shadows on/off. Can write to this to control them (1= On, 0=Off).  Aircraft reflections on/off. (2=On, 1=Off).  G Force: copy of 11BA on touchdown.  G Force: units unknown, but /624 seems to give quite sensible values. See also offset 1140  Angle of Attack Indicator angle, with 360 degrees = 65536. The value 32767 is 180 degrees Angle of Attack. The angle is expressed in the usual FS 16-bit angle units (360 degrees = 65536), with 180 degrees pointing to the 0.0 position (right and down about 35 degrees in a Boeing type AofA indicator). Note that the indicator angle actually decreases as the wing AofA increases.  The FS9 and earlier interpretation was documented as a relative value, giving in %*32767 the difference between the current AofA and the maximum angle of attack for the current aircraft,  Really this revised understanding does not conflict with this, as the indicator would presumably vary from aircraft ot aircraft in any case.  Mach speed *20480.  Total Air Temperature (TAT), degrees Celsius * 256  Fuel: number of fuel selectors available in this aircraft	No SimC SimC Ok-SimC Ok-SimC Ok-SimC	No No P-SimC No No No No

1331		weight including payload and fuel.		
13FC	4	Count of Payload Stations	Ok-SimC	No
1400	48 x n	A set of Payload Station data, 48 bytes for each payload station	Ok-SimC	?-SimC
1100	10 X II	(the count is in 13FC above). Each 48 byte entry contains:	Missing	(weight
		0 double weight (lbs) (Okay in FSX)	parts: ?-simC+	values only)
		8 double, lat dist from datum (ft) (not FSX)	?-SIIIIC+	
		double vert dist from datum (ft) (not FSX)		
		24 double longl dist from datum (ft) (not FSX)		
		char Name[16], zero at end (Okay in FSX)		
		There's room for up to 61 such stations here. If there are more		
		you can't access them this way.		
		These loadings can be changed, and this does have some effect,		
		but are changes are being promulgated to the overall weights		
		(offsets 30C0, 30C8, 3BFC) and balance (2EF8)? Needs		
		checking in FSX.		
1F80	40	Write-only area for a TCAS_DATA structure, used to add	N/A	Ok-Intl
		entries to the TCAS data tables (but NOT to create AI aircraft,		
		please note!). The 40-byte format is as for the TCAS_DATA		
		structure (see offset F080). You need to write it all as one		
		FSUIPC_Write block. You cannot read back what you have		
		written here.		
		You can add more writes to the same (or other) offsets before		
		actually sending them (e.g. via FSUIPC_Process). The only		
		important thing is that the whole TCAS_DATA structure is		
		written in one block, with the length obviously set to 40.		
		The data this structure should contain is as follows:		
		id Any id number UNIQUE to all aircraft you supply. It		
		does not have to be unique to the AI aircraft. FSUIPC		
		keeps an internal flag to distinguish the two types.		
		[Note that if in the future this field is re-used for other		
		indications, FSUIPC may have to adjust the value		
		supplied].		
		lat, lon, alt, hdg, gs, vs, com1		
		As possible: all would be good, but obviously a		
		minimum of lat/lon/alt.		
		idATC Any string of up to 14, plus a zero terminator, to		
		identify the aircraft. This doesn't need to be unique but		
		it could be rather confusing to the user if it isn't.		
		To erase an aircraft provide the specific id for that entry, and set		
		the idATC field to null (i.e. zero length string, just a zero).		
				•

		In any case, FSUIPC will automatically erase any externally supplied aircraft after about 8–12 seconds if it receives no further updates in that time. Even if the aircraft is static you'll need to supply updates for it regularly.		
		Apart from the user-adjustable range, which is applied, FSUIPC is not performing any filtering for these aircraft—i.e. you can include aircraft on the ground if required. However, once the airborne TCAS table is full (current capacity 96) whether with AI aircraft, MP aircraft, or a mixture, no others will be accepted		
		until slots become free. So in this sense slot management is up to

2900	12	A.I. traffic control. Write all 3 32-bit values (i.e. 12 bytes)	N/A	Ok-SimE
		together to send an FS control to a specific AI aircraft. The		(part hacked)
		values needed are:		
		Bytes 0–3: Aircraft Id (from the TCAS table)		
		Bytes 4–7: The FS Control (see published lists) Bytes 8–11: A parameter for the control, if needed		
		Note that most of the many hundreds of FS controls will have no		
		noticeable affect on the AI aircraft. Experimentation is needed. If		
		folks find out what does what, please let me know and I'll try to		
		publish a collated guide as an appendix later.		
		Note that you can write these values in separate FSUIPC Writes,		
		but if you do the ID must be last, as it is only when this is written		
		that the control is activated.		
		The special control value 0xFFFF (65535) is supported as a		
		request to delete the specified aircraft. (This currently uses a		
		hack into the FS code).		
290C	4	Number of Hot Joystick Button slots available for Application	Ok-Intl	N/A
		Programs to use. Currently this is fixed at 56, representing the 56		
2910	224	DWORDs available in the following offsets:  56 DWORDs containing zero (when free for use), or a Hot	Ok-Intl	Ok-Intl
2910	224	Joystick Button specification. See also 32FF below.	OK III.	OK IIII
		roystick Button specification, see also 3211 celow.		
		This "HOT BUTTON" facility allows programs to detect		
		selected joystick button presses. This facility is very similar to		
		the Hot Key system described for offset 3210. Up to 56 such hot		
		buttons can be specified, but this number is shared by all running		
		applications. The facility operates using these offsets:		
		56 32-bit values ("DWORDs") from 0ffset 0x2910 onwards (i.e.		
		0x2910, 0x2914) are 'slots' for Applications to specify Hot		
		Keys. These will be zero initially, and zero if free. The		
		application must search through to find an empty slot, then set		
		this into it:		
		Byte 0 (bits 0-7): Joystick number (0-15) + 128. In other words		
		128 for Joystick 0, 129 for joystick 1, etc.		
		Joysticks are numbered from 0. (Note that Windows 'Game Controllers' numbers from 1).		
		Byte 1 (bits 8-15): Button number (0-39)		
		Again buttons are numbered here from 0. Buttons 0–31 are		
		the normal buttons, numbers 32–39 are a representation of		
		the 8 "Points of View" at 45 degree angles supported by		
		some joystick drivers for the POV Hats.		
		Byte 2 (bits 16-23): Flags from application.		
		This byte indicates which change is to be notified: = 0 for Off to On		
		= 1 for On to Off		
		= 2 for both Off to On and On to Off		
		= 3 for Off to On but repeating about 6 times per		
		second whilst it is on.		
		Byte 3 (bits 24-31): Flags from FSUIPC.		
		Bit 0 (value 1) is set when the specified Hot Button change		
		occurs. Needs to be cleared by Application when seen so it can detect another. (No queuing).		
		Bit 1 (value 2) is set when bit 0 is set only if the button is		
		still pressed. This can be used to differentiate the two		
		events when Byte 2 is given as "2" for both off–on		

	1			
		and on-off events.		
		<b>Note</b> : If the same Hot button is listed more than once (for instance by several applications), every copy for the same Hot button will get the flag set.		
		Use: Having found an empty slot, write the above value into it, then monitor the highest byte of that same slot for Non-Zero. That's the button event. Clear that byte to detect it again. If you register several HotKey Buttons it will be more efficient to only scan the slots themselves when a hot button actually occurs. To detect this, just monitor the one byte at offset 32FF. (This can be paired with 32FE to scan for buttons and keys). When it changes, read and check the flags in your slots. (The count at 32FF may change without any of your buttons occurring, of course, if other applications are trapping other hot buttons).		
		When finished, and certainly before exit, be sure to clear the whole DWORD to zero so other applications can use it. If you only want to use joystick buttons for a certain part of the operation of your program, only set the entries there and clear them when done.		
		Note that if several applications want the same button, they will all get it. Of course, your application can check through the whole list to make sure there are no clashes/duplicates and warn the user if so. You might have to do that at intervals in case a clashing application is loaded after yours.		
29F0	4	This system will work through WideFS with no problems too.  This DWORD provides a facility to set, clear or toggle any of the virtual buttons at offset 3340 without needing to read anything first. To do this, write to offset 29F0 a 32-bit value (4 bytes) made up as follows:		
		Byte 0: Button Number on Joystick (0 - 31)  Byte 1: Virtual Joystick Number (64 - 72)  Byte 2: Action:  0 = Toggle  1 = Set (Press/On)  2 = Clear (Release/Off).  Byte 3: 0 (Reserved)

2FAC 2FAD				

allows an application to add an entry to the Add-Ons menu. The Application finds a free Hot Key slot, then sets it up to receive notification on menu access, and writes the text needed for the menu item to another location. When the menu item is selected, the flag in the hot key slot is set just as when a hot key is used.

This way of accessing the menu has the advantage that it will also work when the application is running on another PC, via WideFS. Of course, any response to that menu selection will occur on whichever PC the application is running.

To avoid having menu items relating to applications that have crashed or terminated without tidying up correctly, each menu item added is subjected to a time-out. Applications have to refresh a count in the Hot Key slot at regular intervals (10 seconds or less) otherwise the menu item is deleted and the Hot Key slot freed. The time-out is suspended when FS is paused, and there is an option to have FS pause automatically when the menu entry is selected.

Note that FS subjects the nuber of entries in the Add-Ons menu to a maximum of 16. FSUIPC is already using one for itself. If the maximum is already reached your entry will simply *not* appear. There is no error indication of this provided back to the Application, though a SimConnect exception may appear in the FSUIPC Log file if exception logging is enabled.

This is the way this facility is used:

- 1. Find a free Hot Key slot (i.e. search the 56 DWORDs at offset 0x3210 for a zero value). Say slot *I* is the one found.
- 2. Write 0x0000FFFF to the slot (i.e to the DWORD at offset 0x3210 + 4\**I*). If you want FS to pause when the menu item is selected, write 0x0002FFFF instead. The 02 part is the flag indicating that a pause is required.
- 3. Write the text for the menu entry required to offset 0x2FE0, with the first byte set to the slot number (*I*). For example, for an entry "UIPC Hello" (H being the shortcut) you would set the string to be written to 0x2FE0 as follows:

```
static chMenuEntry[] = "?UIPC &Hello"; chMenuEntry[0] = I;
```

- 4. The '&' in the string tells Windows which character to underscore, and this denotes the shortcut key, but this is optional.
- 5. The string is limited to 31 characters, including the slot number at the beginning, plus a zero terminator. In other words the offset range is 0x2FE0-0x2FFF inclusive. This area is "write only". Don't expect to be able to read back what you write here.
- 6. The write to 0x2FE0 triggers FSUIPC into asking FS to add the menu entry to the Add-Ons main menu item, but this is dependent upon the slot it references being set with 0xFF in its first (least significant) byte. From the moment the *slot* is set with 0xFF there it is changed every 55 mSecs or so, unless FS is paused or in a dialogue. The change is a decrement of the next byte in the slot—the other one you also set to 0xFF. When this reaches zero, the menu entry is removed and the slot is cleared. This gives a maximum timeout of 255 x 55mSecs, or about 14 seconds. You can make it less, of course, by initialising that byte to a lower

value than 0xFF (255), but I'd recommend sticking to the maximum. This means that if you want the menu entry to stay available you must write 0xFF (or whatever) to that byte (i.e. the slot offset + 1) at regular intervals, say every 10 seconds. The 4 second leeway allows some safety, but you may want more—very little FS overhead is caused by writing that one byte every 1 second if you need to, but this is really over the top. More overhead is caused by writes when running on another PC using WideFS, so I would suggest 5 seconds as a minimum. When the user selects your menu entry, FSUIPC will set the 2<sup>0</sup> (0x01) bit in the top byte (offset+3) in your slot. Just as with Hot Keys, you need to be looking for this at regular intervals, perhaps every 200 milliseconds or so. Frequent reads pose little overhead for WideFS use, but very frequent ones should really be avoided when you are running on the FS PC. 8. After processing the user request, whatever it is, don't forget to clear the indicator so you can detect the next onewriting zero to the byte at the offset+3 is all that is needed. 9. Finally, if you opted for FS to pause when the menu item is selected you need to unpause FS so that it can continue. Write zero to the 16-bit value at offset 0x262. When you no longer need the menu entry, or just before terminating your program, you should write zero to the DWORD Hot Key slot. This will make FSUIPC remove the menu entry immediately. If your program does not tidy up the entry will be removed on the timeout. Adding submenu entries to your menu entry: [Not available in FSUIPC3] Having already setup the main menu, as above, write this, in one write, to 0x2FE0: 0x80 + slot number of main entry, as before Byte 0: (i.e. 0 for 3210, 1 for 3214 etc. Remember the max is 55, there being 56 slots). Byte 1: Response value (any non-zero value 1 - 255). This is merely a value for you to test so you know which submenu was selected. Bytes 2-31 The zero-terminated string for the submenu entry. There's a limit of 16 submenus per menu entry (imposed by SimConnect), and there are no further sub-levels. When the user selects the submenu FSUIPC will fill in byte 3 of the slot with the "Response value" provided. Naturally you don't get notified when the main menu entry is selected when there are submenus. You can remove a submenu by doing the same as above but with a null string for the submenu entry (i.e. a single zero byte). 3108	1	Write 1 here to disable FSUIPC's "AutoTune ADF1" facility, if this has been enabled by the user in FSUIPC.INI.	N/A	?-Intl
3109	1	This is a bit-oriented control flag byte. These bits are allocated so far:	N/A	?-Inti
		2 <sup>0</sup> (1) = 1 to disable AxisCalibration even if enabled in FSUIPC.INI. Note that this "AxisCalibration" is the one specifically concerned with direct offset values—see the		
		Advanced User's guide for the description of the INI parameter for more details.		
		2^1 (2) = 1 to allow the older (FS98-compatible) axis controls to remain connected even when the main axis controls are disconnected via bits in 310A and 310B below. These are AILERON_SET, ELEVATOR_SET, ELEVATOR_TRIM_SET, RUDDER_SET, THROTTLE_SET and the four THROTTLEN_SET controls. Allowing these through will let autopilot of FBW programs control the relevant values without writing direct to the appropriate offsets, but take care also that the THROTTLEN_SET controls aren't being claibrated in the user's 4-throttle option (page 3 in FSUIPC options).		
		2^7(128) is reserved for external applications to use as they wish.		
		In order to protect the user from a broken or crashed application, the 2 <sup>1</sup> flag is cleared 10 seconds after it has been set, so applications will need to repeat the setting every few seconds.		
310A	1	Controls the joystick connection to the main flight controls.  Normally all zero, set the following bits to actually disconnect the specific joystick axes (from least significant bit = 0):  0 Elevator 1 Aileron 2 Rudder 3 Throttles (all). 4 See below (throttle sync control) 5 Elevator trim 6 Throttle #1 7 Throttle #2 (see next byte for others)  This feature is intended for use in protecting autopilot flight	N/A	?-Intl
		from interference from axis flutter. In order to protect the user from a broken or crashed application, all the flags are cleared 10 seconds after they have been set, so applications will need to		

		repeat the setting every few seconds.		
		If the user option is set to automatically disconnect the trim axis in FS A/P vertical modes, the disconnection of Elevator inputs via bit 0 above also disconnects Trim even if bit 5 is not also set. This allows existing A/P or fly-by-wire applications to work with those user implementations using a trim axis.		
		Additionally, bit 2^4 is available to switch "throttle sync" on. In this mode all throttles are driven from the main throttle or throttle 1 inputs, and other throttle inputs are discarded. (The same option can also be used from an optional Hot Key).		
		See also offset 3109 above, and also offsets 3328–3339, which provide the live axis values, post calibration. These would have been applied to FS if not prevented by the flags above. Applications can use these facilities to provide a responsive "flyby-wire" control.		
310B	1	Controls the joystick connection to the slewing controls, and the other two separate throttle controls.	N/A	?-Intl
		Normally all zero, set the following bits to actually disconnect the specific axes (from least significant bit = 0):  0		
		5 Slew Pitch 6 Throttle #3 (see previous byte for #1, #2) 7 Throttle #4		
		In order to protect the user from a broken or crashed application, all the flags are cleared 10 seconds after they have been set, so applications will need to repeat the setting every few seconds. See also offset 3109 above.		
310C	4	Reserved		
3110	8	Operates a facility to send any 'controls' to Flight simulator. This works with <i>all</i> versions of FS & CFS. Write all 8 bytes for controls which use a value (axes and all _SET controls), but just 4 will do for 'button' types.  This is really two 32-bit integers. The first contains the Control number (normally 65536 upwards), as seen in my FS Controls lists. The second integer is used for the parameter, such as the scaled axis value, where this is appropriate. Always write all 8 bytes in one IPC block if a parameter is used, as FSUIPC will	N/A	Ok-Intl
		fire the control when you write to 3110.  Since version 3.40, FSUIPC-added controls (other than the offset ones) can be used via these offsets too. See the Advanced User's		
		Guide for a current list.

		units appear to be the same as the aircraft heading units (see		
2150	4	offset 0580).	N/A	?-SimE
31FC	4	Tug Speed control, for gliders I assume. [write-only]. Units not confirmed, but possible ft/sec.	N/A	?-3IIIIE
3200	12	These locations operate the FSUIPC facility to send keystrokes	N/A	?-Intl
		to FS. For this to operate correctly the PC must be using		
		Windows 98, ME, 2000, XP or Vista. The facilities used just do		
		not exist in Windows 95 or NT.		
		3200 message (WM_KEYDOWN or WM_KEYUP)		
		3204 wParam for the message 3208 lParam for the message		
		All 12 bytes must be written in one IPC write.		
320C	4	Number of Hot Key slots available for Application Programs to	Ok-Intl	N/A
		use. Currently this is fixed at 56, representing the 56 DWORDs		
2210	22.4	available in the following offsets:	Ok-Intl	Ole Intl
3210	224	56 DWORDs containing zero (when free for use), or a Hot Key specification. See also 32FE below.	OK-Inti	Ok-Intl
		Note that although up to 56 such hot keys can be specified, but		
		this number is shared by all running applications. However, an extra key pressed before the main hotkey is released can be		
		requested and supplied, multiplying the number of possibilities		
		immensely without needing many slots.		
		The facility operates using 56 32-bit values ("DWORDs") from		
		offset 0x3210 onwards (i.e. 0x3210, 0x3214). Each of these is		
		a 'slot' for Applications to specify Hot Keys. These will be zero		
		initially, and zero if free. The application must search through to		
		find an empty slot, then set this into it:		
		Byte 0 (bits 0-7): Virtual Keycode (see the list in my FS		
		Controls documents or the FSUIPC Advanced Users		
		Guide).  Pute 1 (hits 8 15): Shift state indicator		
		Byte 1 (bits 8-15): Shift state indicator Bit 0, the least significant, = shift		
		Bit 1= ctrl		
		Bit 2= alt (but use of alt strongly discouraged, see Note 1)		
		Bit 3= "expect another keypress". If this bit is set then		
		when the Hot Key is detected FSUIPC waits for the KEYUP <i>or</i> another key press first. The virtual		
		keycode for that keypress is then returned in Byte 3,		
		below.		
		Bit 4= tab (provided as an extra "shift", for more key press		
		flexibility)		
		Byte 2 (bits 16-23): Flags from application.  Bit 0 (1)=reserved. This was originally used to control the		
		next option, but it was implemented incorrectly in		
		FSUIPC, so now, to avoid problems, the bit is		
		deliberately ignored.		
		Bit 1 (2)= set if Hot Key should be passed through to FS,		
		else it will be trapped. See Notes 1 & 2. Byte 3 (bits 24-31): Flags or results from FSUIPC.		
		This byte needs to be cleared by the application so that it		
		can detect when the Hot Key occurs. There is no queuing.		
		If the Hot Key alone is seen, this byte is set to 1. If bit 3		

	ı			
		was set in Byte 1 above <i>and</i> another key was pressed before the hotkey was released, then the virtual keycode for the extra key (2–255) is provided here.		
		<b>Note 1</b> : ALT key combinations are not a good idea, and cannot be stopped from passing to FS. You can get them, but FS will open the menu in any case.		
		<b>Note 2</b> : If the same Hot key is listed more than once (for instance by several applications), every copy for the same Hot Key will get the flag set, irrespective of the pass-through option. The option only applies to finally passing it to FS. If any one Hot Key user says that the key is <i>not</i> to be passed to FS (i.e. by leaving Flag Bit 1 unset), then it isn't passed through.		
		<b>Note 3</b> : FSUIPC hotkeys, allocated in its "HotKeys" page, take precedence and are not passed through to applications or FS.		
		Use: Having found an empty slot, write the above value into it, then monitor the highest byte of that same slot for Non-Zero. That's the keystroke. Clear that byte to detect it again. If you register several Hot Keys it will be more efficient to only scan the slots themselves when a hot key actually occurs. To detect this, simply monitor the one byte at offset 32FE (this can be paired with 32FF to scan for keys and buttons together). When it changes, read and check the flags in your slots. (The count at 32FE may change without any of your keys occurring, of course, if other applications are trapping other hot keys).		
		When finished, and certainly before exit, be sure to clear the whole DWORD to zero so other applications can use it. If you only want to use keystrokes for a certain part of the operation of your program, only set the entries there and clear them when done.		
		Note that if several applications want the same keystroke, they will all get it. Of course, your application can check through the whole list to make sure there are no clashes/duplicates and warn the user if so. You might have to do that at intervals in case a clashing application is loaded after yours.		
		This system will work through WideFS with no problems too.		
		Add-Ons menu access for Applications: See offset 2FE0.		
32F0	4	This DWORD controls some protected mode facilities in FSUIPC, designed to set known conditions in FSUIPC and prevent access to specific menus, whilst an application is running. Support in FSX not planned yet, and not assured.	Not yet	Not yet
32F4	2	The 16-bit ID of the last menu command item accessed in FS. Not planned for FSX.	No	No
32F6	2	FSUIPC selected technical option inhibits.	Not yet	Not yet
		Set bits here to turn <i>off</i> specific options and prevent the user turning them back on, for a limited time (max 14 seconds). To keep options turned off you need to write this mask at regular intervals (e.g. every 5 seconds).		
		Note that this is not obeyed if the user has selected to option to disallow all external control of his options. If he has done this, you can detect it by reading this location back within the time limit. If it is zero, not the value written, then the user is		

		preventing your control over his settings.		
		Bits allocated are as follows (bit $0 = 2^0$ bit), but support for most of these isn't planned for FSX at present in any case.		
		0 Reverse elevator trim sense 1 Fix control accelerations 2 Rudder spike elimination 3 Elevator spike elimination		
		4 Aileron spike elimination		
		5 Autopilot altitude fix (enable V/S sign corrn.) 6 Extend battery life		
		7 FS clock seconds sync		
32F8	1	This provides options to inhibit certain aircraft operations, for use in breakdown or precise control implementations. Set individual bits for individual subsystems. Currently the following are available, all related to hydraulic power:	Ok-Intl	Ok-Intl
		2^0 Set to inhibit flap operation 2^1 Set to inhibit spoiler operation 2^2 Set to inhibit gear operation 2^3 reserved 2^4 Set to inhibit Engine #1 reserved		
		2^4 Set to inhibit Engine #1 reverser 2^5 Set to inhibit Engine #2 reverser 2^6 Set to inhibit Engine #3 reverser 2^7 Set to inhibit Engine #4 reverser		
		Note that these stop operation from axis and button controls very well, and also from key presses and mouse clicks—but in these latter two cases it is done by detecting a change in the system and changing it back. This works, but the device will sometimes try to move, and this can be noticeable, especially for some		
		reason with the flaps—the indicator gives a little jump and the noise briefly starts.		
32F9	1	Brakes being used flag. This is non-zero if the user has pressed the brakes (left, right or both) recently. It stays non-zero for a second after the last brake control or significant axis increase seen. It does <i>not</i> stay set for continued constant brake pressure via the axis inputs. It operates also for increasing values written	Ok-Intl	N/A
32FA	2	to offset 0C00 or 0C01.  Text display control word. You can display messages from an	N/A	Ok-SimC
321 A	2	external program just like an Adventure. Write the message as a zero-terminated string to offset 3380 (see below), subject to the maximum of 128 characters <i>including</i> the zero terminator, then write a number to this offset, 32FA, as follows:		(multiline window still Internal, via hack)
		0 display till replaced +n display for n seconds, or until replaced -1 display and scroll, or until replaced -n display and scroll, or for n seconds, or until replaced		
		In the last two cases, whether the message scrolls or not depends upon the setting of the "Options—Settings—General—Text Display" option (?). The time limit only applies when scrolling is off, otherwise the message simply expires when fully scrolled off the screen.		
32FC	2	AIR file change counter (incremented by FSUIPC whenever the AIR file as defined at offset 3C00 changes).	Ok-Intl	N/A
		This is also incremented when the FS control to "reload user aircraft" is detected—assign it to a joystick button or to a Key in		

		FSUIPC for this.		
32FE	1	Hot Key change counter, incremented by FSUIPC whenever any	Ok-Intl	N/A
		of the Hot Keys defined in the table at offset 3210 occurs and		
		therefore has its flag set by FSUIPC.		
32FF	1	Hot Button change counter, incremented by FSUIPC whenever	Ok-Intl	N/A
		any of the Hot Buttons defined in the table at offset 2910		
		changes state in the right way, and therefore has its flag set by FSUIPC.		
3300	2	Additional radio and autopilot status indicators (read only	Ok-Intl	N/A
3300	2	access). Allocation by bits which are set when true. Bit $0 = \text{least}$	J	1471
		significant (value 1):		
		0 = reserved		
		1 = good NAV1		
		2 = good NAV2		
		3 = good ADF1		
		4 = NAV1 has DME		
		5 = NAV2 has DME		
		6 = NAV1 is ILS		
		7 = AP NAV1 radial acquired		
		8 = AP ILS LOC acquired (incl BC—see 10) 9 = AP ILS GS acquired		
		10=AP ILS OS acquired		
		11=good ADF2		
		12=NAV2 is ILS		
		13–15 reserved		
3302	2	Assorted FSUIPC options, set by user parameters: read-only via	Not yet	N/A
		the IPC. None yet applicable for FSX.		
3304	4	FSUIPC version number:	Ok-Intl	N/A
		The HIWORD (i.e. bytes 3306-7) gives the main version as		
		BCD x 1000: e.g. 0x1998 for 1.998		
		The LOWORD (bytes 3304-5) gives the Interim build letter:		
3308	2	0=none, 1-26=a-z: e.g. 0x0005 = 'e'  FS version, as determined by FSUIPC: Currently only one of	Ok-Intl	N/A
3306	2	these:	OK III.	IVA
		1 = FS98		
		2 = FS2000		
		3 = CFS2		
		4 = CFS1		
		5 = reserved		
		6 = FS2002		
		7 = FS2004 "A Century of Flight"		
		8 = FSX		
		9 = ESP 10-P3D		
		10=P3D		
330A	2	Fixed <i>read-only</i> pattern, set to 0xFADE. Use this to check that	Ok-Intl	N/A
	=	the values in 3304-3308 are valid (Note: the supplied LIB writes		
		its version number here, but this has no effect and is only for		
		assistance when viewing LOG files).		
330C	2	Assorted status flags, the only ones which are of use to	?-Intl	N/A
		applications being:		
		2^1 When set this indicates that programs have full access		
		to the IPC not. This can be read without triggering the message		
		box to users which tells them of an unaccredited access attempt.  Note that on WideClient it will always be set, assuming		
		WideServer is registered on the FS PC. (should always be 1 in		
		FSUIPC4)		
		2^2 Set if the user has fully registered FSUIPC		

		2^4 Set when the user Throttle Sync option (in the Hot Keys page of FSUIPC options) is enabled.		
330E	1	Count of external IPC applications seen connecting since the session began. Keeps increasing till it gets to 255 then stays at	No	No
		that value.		
330F	17	Reserved area for WideFS KeySend facility		
3320	2	This word is used to activate a facility supported by WideFS to automatically shut down the PCs running WideServer (i.e. this one) and WideClient. The .ini files of each WideFS component which is to activate the shutdown needs the "AllowShutdown=Yes" parameter included. The application performing the shut down action must write 0xABCD to this offset.	Ok-Intl	Ok-Intl
		WideServer automatically resets this word to zero 5 seconds afterwards, before it initiates its own PC's shutdown if specified. This delay is to ensure the Clients get the message before the host dies, and the clearing to zero is done so that the survivors can continue.		
		WideFS also provides the lesser option "AllowShutdown=App" which only closes down the WideClient or, in the case of WideServer, the FS session. Later still the "AppOnly" variation was added, which keeps WideClient running, ready to reload the applications when FS restarts.		
		A hot key facility to invoke this WideFS shutdown from the FS keyboard is provided via WideServer's INI parameters.		
		The pattern 0xDCBA written here invokes a "close application" action. On all WideFS PCs with any form of shutdown allowed, this pattern closes only those applications loaded by WideFS and leaves WideClient running ready to reload them. On the Server, if it is allowed, it closes FS itself. A hot key facility is provided for this variant, too.		
3322	2	WideServer version number, if enabled. Otherwise this is zero.	Ok-Intl	Ok-Intl
		This is a BCD value giving the version number x 1000, for example 0x5110 means version 5.110.		
		See also offset 333C.		
3324	4	This is the altimeter reading in feet (or metres, if the user is running with the preference for altitudes in metres), as a 32-bit signed integer. Please check offset 0C18 to determine when metres are used (0C18 contains '2').  The same value can be calculated from the actual altitude and the	Ok-SimC	?-SimC
		difference between the QNH and the altimeter "Kollsman" pressure setting, but this value ensures agreement.		
3328	2	Elevator Axis input value, post calibration, just before being applied to the simulation (if allowed to by the byte at offset	?-Intl	N/A
332A	2	310A).  Aileron Axis input value, post calibration, just before being	?-Intl	N/A
33211	-	applied to the simulation (if allowed to by the byte at offset 310A).		
332C	2	Rudder Axis input value, post calibration, just before being applied to the simulation (if allowed to by the byte at offset 310A).	?-Intl	N/A
332E	2	Throttle Axis input value, post calibration, just before being applied to the simulation (if allowed to by the byte at offset 310A). This is the single throttle, applied to whichever engines	?-Intl	N/A

		are denoted by the bits in offset 0888.		
3330	2	Throttle 1 Axis input value, post calibration, just before being applied to the simulation (if allowed to by the byte at offset 310A).	?-Intl	N/A
3332	2	Throttle 2 Axis input value, post calibration, just before being applied to the simulation (if allowed to by the byte at offset 310A).	?-Intl	N/A
3334	2	Throttle 3 Axis input value, post calibration, just before being applied to the simulation (if allowed to by the byte at offset 310A).	?-Intl	N/A
3336	2	Throttle 4 Axis input value, post calibration, just before being applied to the simulation (if allowed to by the byte at offset 310A).	?-Intl	N/A
3338	2	Elevator Trim Axis input value, post calibration, just before being applied to the simulation (if allowed to by the byte at offset 310A).	?-Intl	N/A
333A	2	Throttle lower limit. This is normally 0 if no reverse is available, otherwise gives the reverse limit such as –4096 (for 25%).	?-SimC	No
333C	2	WideFS flags: those used so far are:  2^0 1 = if TCP is being used, 0 if SPX 2^1 1 if connected at all, 0 is waiting for connections  See offset 3322 for WideFS version number, which also		
333E	2	confirms that WideServer is registered and running.  Weather clear count: This is incremented every time FS's "clear	No	No
		weather" routine is called, for whatever reason.	Ok-Intl	Ok-Intl
3340	36	This area is used for externally signalled "joystick button" control, a set of 288 "virtual buttons". Each DWORD or 32 bits represents one "joystick" with 32 buttons. If an external program sets or clears a bit in any of these 9 DWORDS the "Buttons" page in FSUIPC will register the change as a button operation on one of Joystick numbers 64 to 73 (corresponding to the 9 DWORDs). So, FSUIPC can be used to program whatever actions the user wants.		
		See also offset 29F0		
3364	1	FS2004 "Ready to Fly" indicator. This is non-zero when FS is loading, or reloading a flight or aircraft or scenery, and becomes zero when flight mode is enabled (even if the simulator is paused or in Slew mode).  (Note that in FSX it tends to only be set during initial loading. Use together with 3365)	Ok-SimE (See note)	N/A
3365	1	"In Menu or Dialog" flag. This byte is non-zero when FS is effectively paused because the user accessed the Menu, or is in a dialogue resulting from menu or other selection activity.  The non-zero values are:  1 = FS frozen because of menu activity	Ok-SimE (See note)	N/A
		1 = FS frozen because of menu activity 2 = FS frozen because of modal dialogue		
		Both bits may be set in dialogues accessed through the menu. Note that the 2 bit may flicker a little on exit from the dialogue, due to the way it is detected.		
		(In FSX these two states may be a little confused. Not also that FSX does <b>not</b> freeze whilst navigating menus – it only does so in the dialogues themselves, and then not all of them)		
3366	1	This byte reflects the FS2004 "Engine on Fire" flags. I'm not sure if FS actually simulates such events, but it appears to have allocated Gauge-accessible variables to indicate them. This byte	Ok-SimC	Ok-SimC

270 = Exit1 273 = Exit 4.  N.B. FSUIPC4 does handle up to 8 doors, one for each bit 0-7. Whether FSX can actually process Exits 5-8 is unknown however.  336C 2 Frame rate calling counter. This is simply a number that is incremented each time FSUIPC is entered from FS using the entry related to frame rates.  336E 2 Toe brake axes have been selected as "Set" in FSUIPC's joystick pages if this is non-zero. Byte 336E is non-zero for Left Brake, byte 336F for Right Brake.  Note that this only means that the user has told FSUIPC to handle the toe braking, by pressing "Set". It will only actually do so if it sees brake messages.  3370 4 Four single byte PFC driver "alive" counters:  3370 = COM port read thread alive and running  3371 = Elevator trim motor action (0=off, 1=up, 2=dn)  3372 = COM port write thread alive  3373 = Main FS chain alive  N.B. without the main FS chain running the other three aren't maintained in any case, so mean nothing.  3374 4 This is the "live" millisecond count as used in the FSUIPC Log. It is updated on each FS chained call to FSUIPC.  3378 4 This is the millisecond timestamp value of the most recent line in the current FSUIPC Log. It is updated when each line is logged.  337C 1 Propeller de-ice switches, (1 = on, 0 = off), read for state, write	SimE I/A I/A
3367   1 This byte shows doors that are open, one bit per door:   2^0 = Exit1 2^3 = Exit 4.   N.B. FSUIPC4 does handle up to 8 doors, one for each bit 0-7. Whether FSX can actually process Exits 5-8 is unknown however.   3368   4 Reserved for PFC.DLL events.   336C   2 Frame rate calling counter. This is simply a number that is incremented each time FSUIPC is entered from FS using the entry related to frame rates.   336E   2 Toe brake axes have been selected as "Set" in FSUIPC's joystick pages if this is non-zero. Byte 336E is non-zero for Left Brake, byte 336F for Right Brake.   Note that this only means that the user has told FSUIPC to handle the toe braking, by pressing "Set". It will only actually do so if it sees brake messages.   3370   4 Four single byte PFC driver "alive" counters:   3370 = COM port read thread alive and running     3371 = Elevator trim motor action (0=off, 1=up, 2=dn)     3372 = COM port write thread alive     3373 = Main FS chain alive     N.B. without the main FS chain running the other three aren't maintained in any case, so mean nothing.   3374   4 This is the "live" millisecond count as used in the FSUIPC Log. It is updated on each FS chained call to FSUIPC.   3378   4 This is the millisecond timestamp value of the most recent line in the current FSUIPC Log. It is updated when each line is logged.   337C   1 Propeller de-ice switches, (1 = on, 0 = off), read for state, write	I/A
2^0 = Exit1 2^3 = Exit 4.     N.B. FSUIPC4 does handle up to 8 doors, one for each bit 0-7. Whether FSX can actually process Exits 5-8 is unknown however.   3368	I/A

3518	8	This double provides the FS-set "Ambient Wind Y" value within about one second of offset 3478 being written by an application, to control up and down drafts. This allows such a program to monitor FS/scenery arranged updrafts and adjust its actions	Not yet	N/A
3520	2	accordingly.  Earliest version number of connected WideClients (or clients which have been connected). Zero if no connections have been made, or if all connected clients have been version 6.441 or before.	Ok-Intl	N/A
3541	1	This operates the FSUIPC "freeze flight position" facility. This keeps the aircraft at the same latitude and longitude for as long as it is engaged. The altitude and attitude of the aircraft is free to change, and, in fact, the aircraft flies as normal except for not changing its position over the ground. This is apparently a very useful facility for training environments.  For program control, write a non-zero values to this one byte offset. This acts as a timer. The freeze will last for as long as this byte is non-zero. It is used as a time, counting down 1 every timer tick of 55 mSecs or so. To retain the freeze for a good time, write 255 here and do so every 5–10 seconds. Allow for WideFS delays.  Note that if FS is paused, then the freeze lasts until the pause is	N/A	Ok- Intl/SimC
3542	2	released and re-engaged.  Standby altimeter pressure setting ("Kollsman" window). As millibars (hectoPascals) * 16. [This is used by FSUIPC to	Ok-Intl	Ok-Intl
3544	4	maintain offset 3544. It is not used by FS at all]  This is the standby altimeter reading in feet (or metres, if the user is running with the preference for altitudes in metres), as a 32-bit signed integer. Please check offset 0C18 to determine when metres are used (0C18 contains '2').	Ok-Intl	Ok-Intl

		This value is maintained by FSUIPC using the pressure setting		
		supplied in offset 3542. It isn't used in FS itself, but is supplied		
		for additional gauges and external altimeters so that the standby		
		can be kept at the correct (or last notified) QNH whilst the main		
		altimeter is used for Standard settings (for airliners flying Flight		
		Levels).

SDAO	40	Area used by PFCFSX.DLL for axis input, for optional assignment and calibration in FSUIPC.	OK-IIIII	OK-IIIII
		When the PFC driver is not being used, other programs can make use of these offsets to input axis values directly to FSUIPC, which also can then be assigned in FSUIPC and thence calibrated. Note that by default FSUIPC assumes that the normal input here is in the range 0–127, and scales it accordingly. For applications supplying a greater range, possibly up to the maximum allowed for joysticks (–16383 to +16383) you can either use the "RAW" option, or, better, let FSUIPC adjust its scaling to suit the range being input. It will adjust this automatically upon seeing the extreme values, or you can preset the scaling using a parameter added to the axis assignments line in the INI file.  When the PFC driver is running, application programs or modules can access the raw PFC axis values at these offsets, which are assigned to the hardware as listed below. One 16-bit word is allowed for each (although the PFC axes have a maximum range of 0 to 127). The axes are:  3BA8 0 Aileron 3BAA 1 Elevator 3BAC 2 Rudder 3BAB 3 Quadrant axis 5 3BB0 4 Quadrant axis 5 3BB0 4 Quadrant axis 1 3BB4 6 Left toe brake 3BB6 7 Quadrant axis 6 3BB8 8 Quadrant axis 4 3BBA 9 Quadrant axis 2		

			ı.	
		3BC0 12 Aileron trim		
		3BC2 13 Rudder trim		
		3BC4 14 Steering tiller 3BC6 15 not used		
		There are control flags (to disconnect these axes) at offset 3BC8.		
		Each bit, 2 <sup>o</sup> to 2 <sup>o</sup> 15 can be set to disconnect the equivalent		
		numbered axis above.		
3BD0	1	Reserved	Ok SimF	NI/A
3BD2	2	This is a 16-bit counter that is incremented each time a FLT file	Ok-SimE	N/A
		is saved in FS. This applies to flights saved through FS Flights menu, the shortcut key (;), AutoSave, and via the FSUIPC flight		
		saving facilities.		
		saving facilities.

3BF6	2	SimConnect re-connection count. This is incremented each time	Ok-Intl	N/A
	_	FSUIPC4 succeeds in connecting or re-connecting to		
		SimConnect.		
		Re-connection is sometimes needed if SimConnect starves		
		FSUIPC4 of information for longer than the timeout (set by the		
		INI parameter <b>SimConnectStallTime</b> , defaulting to 1 second),		
		other than during normal flight loading or menu stoppage times		
2DE0	2	(i.e. between Stop and Start notifications).	Ok-SimC	No
3BF8 3BFA	2	Number of flap positions not including flaps full up.  Flaps détente increment. The full range of flap movement is 0—	Ok-	No
ЭВГА	2	0x3FFF (16383). Each détente position or "notch" is spaced	Intl/SimC	140
		equally over this range, no matter what flap angle is		
		represented—a table in the AIR file gives those. To obtain the		
		number of détentes, divide this increment value into 16383 and		
		add 1. For example 2047 (0x7FF) would be the increment for 9		
		positions.		
3BFC	4	Zero Fuel Weight, lbs * 256. This is the aircraft weight plus the	?-SimC	No
		payload weight, minus fuel. This changes as the payload is		
		adjusted.		

		Note that this value fluctuates slightly. It is not clear whether this a bug, or an artefact of the physics simulation, but the empty weight (1330) and the payload data (1400) may be used to get a static value.		
3C00	256	Full pathname of the current AIR file (in UNC form when applicable *). This is zero padded to fill the 256 bytes available. When this changes the 16-bit counter at 32FC is incremented, so interested programs don't have to keep on reading the whole 256 bytes to check.	Ok-SimE (small difference, see description)	No
		Note: If you are accessing this from a Gauge, it has been reported that it will not contain the correct aircraft path until FSX loads the gauges completely and begins the update sequence PANEL_SERVICE_PRE_UPDATE PANEL_SERVICE_POST_UPDATE		
3D00	256	* UNC paths are only used if WideFS is in use  Name of the current aircraft (from the "title" parameter in the AIRCRAFT.CFG file).	Ok-SimC	No
3E00	256	Path of the Flight Simulator installation, down to and including the FS main folder and a following \ character. If the PC is on a Network and WideFS is in use, then if possible the full UNC (universal naming convention) path is given. Examples are:  D:\FS2000\ (non-Network) \\MyMainPC\drived\FS2000\ (Network, named PC and named shared drive))	Ok-Intl	No
3F00	2	To load or save a Flight (.FLT) you first set up the pathname (and optional description) at offset 3F04 below, then write here. Write one of these values:  0 to simply load the specified flight/situation. 1 to save the flight/situation with no description 257 to save the flight/situation with a description Flights are saved in the "My Documents" FS folder. Flights are loaded by default from there too – you don't have to specify a path.  If you are Loading a file, please allow time for the file to load before expecting any further meaningful response across the FSUIPC interface. FSUIPC will probably not be able to respond for several seconds even on the fastest machines.	N/A	Ok-SimC
3F02	2	FLT/STN file loading counter (incremented by FSUIPC whenever the FLT or STN file, as defined at offset 3F04 changes. [Note this this is different from FSUIPC3 where it is also incremented on a reload with the same name].  If FSUIPC4 re-initialises the SimConnect link at any time (e.g. because of timeout), the flight name provided may change at the same time, due to the way SimConnect operates and FSUIPC obtains the flight names. The value in offset 3BF6 also updates when SimConnect is re-initialised, so this may help distinguish	Ok- Intl/SimC	N/A
3F04	252	the cause of the change.  READ:  Pathname of the currently loaded FLT file, excluding the FS main path (see 3E00) if applicable, else the full path, in UNC format if WideFS is in use. This is zero padded to fill the 252 bytes available, or truncated if longer.  When this changes (or simply reloaded) the 16-bit counter at 3F02 is incremented, so interested programs don't have to keep on reading the whole 252 bytes to check.	Ok-SimC	Ok-SimC

		WRITE: Write the file name for the FLT+WX file you wish to Load or Save. The name can include the final ".flt" but this will be discarded in any case. You can specify a folder (existing within FS's main folder) for Loading, but files can only be saved to your "My Documents" FS folder. If you give a path for saving, it is discarded. There must be a zero terminator.  If you are writing the file, a description can also be specified,		
		following the pathname and its zero terminator. Obviously this is limited by the space available. It must also be terminated by a zero byte, and indicated in the value written to 3F00 above.		
		See 3F00 above for details of actually Loading or Saving the Flight or Situation so identified.

		B800–BFFF = Weather at requested location (READ)		
		For ICAO ID or Lat/Lon written in CCxx area.		
C000	4096	FS2004 style NWI ("New Weather Interface") areas, allowing	Ok-SimC	Ok-SimC
C000	+070	both local and global weather data to be read and written.		
		C000–C3FF = Interpolated weather at aircraft (READ)*		
		C400–C7FF = Global weather "GLOB" (READ)**		
		C800–CBFF = Weather writing area (WRITE)		
		For GLOB or ICAO ID as specified.		
		CC00–CFFF = Weather at requested location (READ)		
		For ICAO ID or Lat/Lon* as specified.		
		ToricAO iD or Lav Loir as specified.		
		The "read at requested location" facility is extended to read the		
		weather at the user aircraft position, by giving an ICAO of		
		'????'. This is the same as giving the aircraft's Lat/Lon, but a bit		
		easier. (Global is read by 'GLOB', as before). Additionally, the		
		ICAO field can be set to " ? " to get the weather set at the		
		nearest weather station to the user aircraft. The ICAO id of that		
		station is returned in the ICAO field.		
		** A facility is also provided to force ECV into alabel		
		** A facility is also provided to force FSX into global-only weather, so that instructor stations, for example, can set weather		
		reliably. This is also automatic for the AWI and FS98 interfaces.		
		* Note that interpolated weather (at singraft on Lat/Lan) does not		
		* Note that interpolated weather (at aircraft or Lat/Lon) does <i>not</i>		
		include local layer information (for visibility, winds and		
		temperature) other than for the layer at the aircraft altitude. The		
		other layers are obtained from the nearest Weather Station.		

D000	20		Ok-Intl	Ok-Intl
D000	20	<u>Detecting runways in use</u>	(via SimC)	OK-IIIII
(1 <sup>st</sup> use)		This facility gives applications a better chance of detecting the runways in use at any selected airport in range (i.e. within 85nm or so of the user aircraft). The Weatherset2 program provided with FSUIPC makes use of this to show any runways currently assigned when AI traffic is active at a weather station selected by ICAO code.		
		This is the interface for this:		
		D000 32-bit signature (see below) D004 4 character ICAO of airport D008 32-bit timestamp D00C 4 bytes giving up to 2 departure runways, format: Number (1 byte), Designator (1 byte) D010 4 bytes giving up to 2 arrival runways, format: Number (1byte), Designator (1 byte)		
		Runway numbers: 1–36 plus 37=N, 38=Ne, 39=E, 40=Se, 41=S, 42=Sw, 43=W, 44=Nw		
		Designators: 0=none, 1=L, 2=R, 3=C, 4=W		
		Procedure:		
		1. Write your signature value (generated by your program, to prevent simultaneous access by others), and the ICAO at the same time. If you use separate writes, write the ICAO first, but use one FSUIPC_Process call.		
		2. Read the timestamp. This is best done in the same FSUIPC_Process call as the writes.		
		3. Read the ICAO, timestamp and 8 bytes of runway details until the timestamp changes (or until you time-out). Then check that the ICAO you read is the one you want. If so, then the runway bytes are either zero (if there aren't any known) or they are filled in for you.		
		4. Write zero to the signature to free the interface for others. If you don't do this, FSUIPC will clear it in any case within about 12-15 seconds of action 1 above.		
		Notes:		
Paga		The runways are gleaned from the data in the tables at D040 and D840, described below, but FSUIPC is here looking through ALL the traffic, i.e. all traffic within FS's own 80–90nm radius. It is not restricted it by the user-set radius, nor the smaller ground limit.	0	O Lea
D000	16	Reading full AI Traffic identity strings	?-IntI/SimC	?-Intl
(2 <sup>nd</sup> use)		The offset area at D000 can also be used to read full AI aircraft data strings. To do this, proceed as follows:		
		Write the selected command, from list below, to D004 (32-bit DWORD)		
		2. Read the timestamp at D008 (32-bit DWORD)		
		3. Write the AI id (from the TCAS table, see earlier) to D00C (32-bit DWORD)		
		4. Write a signature to D000 (32-bit DWORD)		
		It is probably best to do all that in one FSUIPC Process call—in		

	recent versions of WideFS the read should be separated out for you in any case. The order isn't important except that you must write the signature last.		
	If you want to do another within 14 seconds, use the same signature. Use a signature of zero to allow anyone to do the same thing at the same time, but then be aware that your data may not be what you asked for.		
	5. Wait till the timestamp in D008 changes.		
	6. Read string result (up to 48 bytes including terminating zero) from D010.		
	The command values available are:		
	1 = Tail Number 2 = Airline name + Flight number 3 = ATC aircraft type, plus ATC aircraft model * 4 = Aircraft title 5 = ATC aircraft type + last 3 digits of tail number		
	* The aircraft type is one zero-terminated string, and the model is another, following immediately. If either are missing you'll still get the null string (i.e. just the zero terminator).		
	Except for the last case where 3 digits are extracted deliberately (in accordance with ATC practice), none of these strings are likely to be abbreviated, except perhaps any long Aircraft Titles. In other words don't expect the string read in command 2 to be the same as the 14 character version in the TCAS tables—though the beginning and end will be, of course.		
	AI ground aircraft additional traffic data. An array of 96 x 20 byte structures as follows:	(excepting items	N/A
20)	TCAS DATA2	marked **)

Except for the last case where 3 digits are extracted deliberately (in accordance with ATC practice), none of these strings are likely to be abbreviated, except perhaps any long Aircraft Titles. In other words don't expect the string read in command 2 to be the same as the 14 character version in the TCAS tables—though the beginning and end will be, of course.  Al ground aircraft additional traffic data. An array of 96 x 20 byte structures as follows:  1920  Al ground aircraft additional traffic data. An array of 96 x 20 byte structures as follows:  10 No name 1 Ramp parking 2 N Ramp parking 3 NE Ramp parking 4 E Ramp parking 5 SE Ramp parking 6 S Ramp parking 9 NW Ramp parking 10 Gate 11 Dock 12-37 Gate A to Gate Z  1 BYTE bGateType This is a numeric representation of the gate type, when one is assigned. Otherwise it is zero. The values are as in the BGL, as follows:  1 Ramp (GA) 2 Ramp small 3 Ramp medium 4 Ramp large 5 Ramp Cargo 6 Ramp Military Combat 8 Gate medium 9 Gate medium 9 Gate medium

			0 = Tail number 1 = Airline + Flight number 2 = Type 3 = Title 4 = Type + last 3 digits or tail number 5 = Model			
		Byte 3 = 0 nor table is		ving preference to nearer aircraft when the		
			ered inacti	ference to active aircraft. An aircraft is ve if it is in states x80 or x81 (initialising		
		Bytes 4–7 Reserv	ed.			
		Normally most of	f these op	tions will be as set by the user via the		

E080	3840	FSUIPC options dialogue or INI file. Applications can change them by writing to these bytes, independently for ground and airborne traffic (the latter at F068). However, FSUIPC will automatically re-instate the user's settings in approximately 20 seconds after the last write to any one of these bytes (airborne or ground). If an application wants to continue with changed settings it must re-write that changed setting at regular intervals. I would suggest using an interval of no more than 5 seconds in order to allow for delays when Networking is being used or FS is under other loads.	Ok-SimC	N/A
		AI ground aircraft traffic data. An array of 96 x 40 byte structures as follows:		
	(96 x 40)	TCAS DATA		
		0 DWORD id 0 = empty, otherwise this is an FS-generated ID. FSUIPC makes this negative to distinguish FS entries from user added ones.		
		4 float lat 32-bit float, degrees, -ve = South		
		8 float Ion 32-bit float, degrees, -ve = West
